Nomenclature is a library providing access to linux's namespace manipulation functions. The current version exposes the raw syscalls.

CHAPTER 1

API Documentation

Syscalls to manipulate linux namespaces.

`nomenclature.syscalls.setns (fd, nstype)`

Reassociate thread with a namespace

Parameters

- **int** (*nstype*) – The file descriptor referreing to one of the namespace entries in a :directory:`/proc/<pid>/ns/` directory.
- **int** – The type of namespace the calling thread should be reasscoiated with.

`nomenclature.syscalls.unshare (flags)`

Disassociate parts of the process execution context.

Parameters **int** (*flags*) – A bitmask that specifies which parts of the execution context should be unshared.
